# Artificial Intelligence: Prediction Model of diabetes diseases

## Introduction:

This project aims to develop an AI-powered prediction model that can accurately forecast diabetic prediction based on historical data.

## Modules:

Here are some modules that we have to import before going further.

```
1 import pandas as pd
2 import numpy as np
3 import pickle
4 from sklearn.preprocessing import StandardScaler
5 from sklearn.model_selection import train_test_split
6 from sklearn import svm
7 from sklearn.metrics import accuracy_score
```

Figure 1

## Methodology:

This project employed a machine learning approach to develop a loan status prediction model. The methodology consisted of the following steps:

**1. Data Collection:** A dataset containing loan applications, credit reports, and loan status (default or non-default) was collected from Kaggle.

Data loading

```
1 Ddata = pd.read_csv(filepath_or_buffer=r"D:\superior\semester_3rd\lab_AI\final project\diabetes.csv")
```

Figure 3

**2. Data Preprocessing:** The dataset was cleaned, transformed, and normalized to prepare it for modeling

## Artificial Intelligence: Prediction Model of diabetes diseases

```
Data loading

1  Ddata = pd.read_csv(filepath_or_buffer=r"D:\superior\semester_3rd\lab_AI\final project\diabetes.csv")
```

Figure 4

```
1  Ddata.shape

(768, 9)

1  Ddata.info()

<class 'pandas.core.frame.DataFrame'>
RangeIndex: 768 entries, 0 to 767
Data columns (total 9 columns):
#   Column                Non-Null Count  Dtype
---  -
0   Pregnancies            768 non-null    int64
1   Glucose                768 non-null    int64
2   BloodPressure          768 non-null    int64
3   SkinThickness          768 non-null    int64
4   Insulin                768 non-null    int64
```

Figure 5

## Artificial Intelligence: Prediction Model of diabetes diseases

```
1 def conversion(cols):
2     for col in cols:
3         Ddata[col] = Ddata[col].astype("int64")
4     cols = ['BMI', 'DiabetesPedigreeFunction']
5     conversion(cols=cols)
```

```
1 Ddata.info()
```

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 768 entries, 0 to 767
Data columns (total 9 columns):
```

Figure 6

```
1 Ddata.groupby(by='Outcome').mean()
```

```
1 Ddata.to_csv(path_or_buf=r"D:\superior\semester_3rd\lab_AI\final project\encoded_diabetes.csv")
```

Figure 7

**3. Feature Engineering:** Now we split data into x and y train and test for model evaluation.

### Train Test split

```
1 x = Ddata.drop(labels=['Outcome'], axis=1)
2 y = Ddata['Outcome']
```

Figure 8

```
Data Standarization

1 scaler = StandardScaler()
[14]

1 scaler.fit(X=x)
[15]

...

1 stand_data = scaler.transform(X=x)
[16]
```

Figure 9

```
1 x_train , x_test , y_train , y_test = train_test_split(x,y , test_size=0.2, stratify= y, random_state=2)
```

Figure 10

**5. Model Evaluation:** The performance of the selected model was evaluated using metrics such as accuracy, precision.

```
Training the model

1  model = svm.SVC(kernel='linear')
19]

1  model.fit(X=x_train,y=y_train)
20]

..

1  pickle.dump(obj=model,file=open(file='model_svc.pkl',mode='wb'))
21]
```

Figure 11

### Results:

The results of the project are presented below:

**Model Performance:** The random forest model outperformed other algorithms, achieving an accuracy of 80%,

```
1  train_accuracy = model.predict(X=x_train)
2  train_accuracy = accuracy_score(y_true=train_accuracy,y_pred=y_train)

1  print(f'Accuracy score of model: {train_accuracy}')
```

Accuracy score of model: 0.7736156351791531

```
1  test_accuracy = model.predict(X=x_test)
2  test_accuracy = accuracy_score(y_true=test_accuracy,y_pred=y_test)
```

Figure 12

## Artificial Intelligence: Prediction Model of diabetes diseases

Figure 13

Diabetic Prediction: The model accurately predicted loan status for 75% of the test dataset.

```
1 test_accuracy = model.predict(X=x_test)
2 test_accuracy = accuracy_score(y_true=test_accuracy,y_pred=y_test)

1 print(f"Accuracy of test: {test_accuracy}")

Accuracy of test: 0.7597402597402597
```

Figure 14
